Assignment based on Lecture-1

- **Group 1: Understanding Data and Structure**
  - Task: Define data and structure in your own words. Provide five real-world examples where data is organized systematically and explain how it is structured.
- **Group 2: Data Items and Group Items**
  - Task: Differentiate between single data items and group data items. Create a table with at least five examples, showing which items are single and which are grouped.
- **Group 3: Entities and Attributes**
  - Task: Define entity and attributes. Select three different entities (e.g., Car, Employee, Book) and list five attributes for each. Represent them in a structured table**.**
- **Group 4: Data Representation in Tabular Form**
  - Task: Construct a tabular representation of a real-world dataset (e.g., School Library, Hospital Records, Employee Database). Label fields, records, and files correctly.
- **Group 6: Understanding Fields, Records, and Files**
  - Task: Using Microsoft Excel or Google Sheets, create a sample dataset for a university student database. Define fields, records, and files, and provide five sample student entries**.**
- **Group 7: Inventory Management System Case Study**
  - Task: Based on the automobile dealership example, create a hypothetical inventory file for a retail store. Include serial number, product type, year, price, and additional attributes.
- **Group 8: Data Classification and Hierarchy**
  - Task: Describe data classification using a hierarchy (Fields → Records → Files). Create a diagram to represent this hierarchy and provide a short explanation.

- **Group 9: Real-World Application of Elementary Data Organization**
  - Task: Research how elementary data organization is used in banking, e-commerce, or healthcare. Present your findings with examples and diagrams.
